Introduction

Entanglement is a key feature of quantum physics and can be used as a resource to complete various tasks, such as teleportation, key distribution, dense coding, and many others. Studying average and typical entanglement is necessary for learning about the useful part of entanglement and what utility random states have. In this work, we consider the average and typical entanglement of Gaussian Boson Sampling output states.

\[
L^2(\mathbb{R})^{\otimes k} \ni |s_{\kappa}^{\otimes k} \rangle \rangle \quad \rho(U) \\
L^2(\mathbb{R})^{\otimes (n-k)} \ni |s_{\ell}^{\otimes (n-k)} \rangle \rangle
\]

Figure 1: Pictorial representation of the setup we consider.

To begin, \( k \) harmonic oscillator modes are initialized in a product states of squeezed vacuum states \( |s \rangle \in L^2(\mathbb{R}) \) with squeezing strength \( s \). Then, a Haar random passive (energy-conserving) Gaussian unitary \( U \) is applied to the \( n \) modes. Note that the group of passive Gaussian unitaries is isomorphic to \( Sp(2n) \otimes O(2n) \approx U(n) \). Finally, we consider the Rényi-2 entanglement entropy, \( S_2(U) = -\operatorname{Tr}(\rho(U)^2) \), of the final reduced state on \( 1 \leq k \leq n \) modes, \( \rho(U) \).

Average entanglement

We study the average entanglement in a subsystem of \( k \) modes, \( B_{k(n)}(U_{\otimes(n)}) \). Viewed as a function of \( k \), this quantity is known as the Page curve. Using the Rényi-2 Page curve, we can also upper and lower bound the von Neumann Page curve.

Theorem (Rényi-2 Page curve)

Let \( s \in \mathbb{R} \) and \( r \equiv k/n \in [0,1] \). Then, asymptotically in \( n \to \infty \),

\[
E_{U \in U(n)} S_2(U) = n \alpha(s, r) - \lambda(s, r) + o(1),
\]

where

\[
\alpha(s, r) = \sum_{\ell=0}^{\infty} \frac{\tanh^{2\ell}(2s)}{2^\ell (2\ell)!} \left[ \frac{1}{r} - \frac{\ell^2 + 1}{r^2} \right] \Gamma(1 - \ell, \ell + 2, r),
\]

\[
\lambda(s, r) = \frac{1}{2} \log[1 - 4r(1 - r) \tanh^2(2s)],
\]

where \( \Gamma \) is the hypergeometric function. At \( r = 1/2 \), these simplify to \( \alpha(s, 1/2) = \log \cosh s \) and \( \lambda(s, 1/2) = \frac{1}{4} \log \cosh (2s) \).

Figure 2: (a) Exact results for the Rényi-2 Page curve. (b) Numerical simulations of the Rényi-2 Page curve for \( n = 50 \) modes and squeezing \( s = 3/4 \). We plot the values for each \( k \in \{0, 1, \ldots, 50\} \).

The typical entanglement proof again crucially relies on the symmetry \( k \to n - k \) of the entanglement entropy. Specifically, we derive the functional form of the variance \( \operatorname{Var}_{U \in U(n)} S_2(U) \) using the symmetry and show that the variance is asymptotically independent of the number of modes. Then, we utilize the variance in Chebyshev’s inequality to prove typically.

Theorem

Let \( s \in \mathbb{R} \) and \( r \equiv k/n \in [0, 1] \). Then,

\[
\lim_{n \to \infty} \frac{\operatorname{Var}_{U \in U(n)} S_2(U)}{n} = \sum_{d=0}^{\infty} \omega(d) \tanh^{2d}(2s) (1 - r)^d,
\]

where \( \omega(d) \in \mathbb{Q} \) is some number that depends only on \( d \). In particular, \( \omega(1) = 1/2 \).

Typical entanglement

Typicality is of interest because it characterizes the applicability of statistical averages. In order to quantify the deviation from average, we consider two measures of deviation corresponding to multiplicative and additive distance. If the multiplicative distance between a quantity and its average vanishes in the thermodynamic limit, then that quantity is called weakly typical. If the additive distance vanishes in this limit, then that quantity is called strongly typical.

Definition

Let \( S \) be a nonnegative random variable on the unitary group \( U(n) \), and denote its value at \( U \in U(n) \) by \( S(U) \). \( S \) is called weakly typical if for any constant \( \epsilon > 0 \),

\[
\lim_{U \in U(n)} |S(U) - \mathbb{E}[S(U)]| < \epsilon = 1.
\]

\( S \) is called strongly typical if for any constant \( \epsilon > 0 \),

\[
\lim_{U \in U(n)} |S(U) - \mathbb{E}[S(U)]| < \epsilon = 1.
\]

Table 1: Rigorous results on typical entanglement in Gaussian bosonic systems. Note that “weak*” indicates that the result is not fully proven, but depends on a conjecture that we make.
